

Case Study: Greater Baltimore Medical Center

Customer:

Type of Business: Hospital
(Infection Control/
Sterile Processing)

Location: Baltimore, MD

Product: Stainless Steel Cabinetry

Type of Application: Design and upgrade of sterilization area

Customer Benefits:

The GBMC facility had a two opening stainless steel sink and needed to expand to a three opening sink for their sterilization process.

By working closely with Indoff the challenge of a weekend renovation was accomplished on time and to the complete satisfaction of GBMC.

GBMC is now able to sterilize their surgical equipment in the three sink sterile processing area which provides enhanced protection for their patients.

Project Overview:

Bob Barroll, Indoff's local sales professional, planned the project, wrote specifications and provided a cost effective solution.

GBMC wanted a continuous 11'-5-1/2" 3 opening sink with shelves on one side and pull out drawers on the other side. Installation was to be completed over a weekend. (Installation could not interfere with GBMC's operating schedule). The floor had to be replaced in front and the sink had to be completely sealed on all walls and the floor.

A specially designed sink was fabricated, fabrication drawings were approved, plumbing contractors were brought in for an approval meeting and the installation was conducted during the weekend as requested.
